                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         δ
                                                                          The present sequence represents a Borrelia afzelii ACAI protein. The present invention describes an isolated nucleic caid (1) that: (i) crocodes a polypeptide fragment (II) immunologically reactive with accodes a polypeptide fragment (II) immunologically reactive with cabbit polyclonal antibody raised against a 13 kDa polypeptide of Borrelia burgdorferi B313, but not reactive with most proteins from ther spirochaetes; and/or (ii) hybridizes under stringent conditions to specific nucleic acid sequences but not to genomic DNA from most other spirochaetes; (I), (II) and transformed cells are useful in caccines to protect against infection by B. burgdorferi sensulation (I), (II) and antibodies raised against (II) are used to diagnose such infections, in standard immunoassays or amplification/hybridization tests. (I) are also used to produce recombinant (II). The I3 KD protein is involved in virulence and is highly conserved within B. burgdorferi sensulato, but is absent from other Borrelia species (e.g. those responsible for relapsing fever or avain borrelosis). It should provide a more specific and sensitive antibody response, and diagnosis, compared with use of whole bacteria as antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

present invention describes an isolated nucleic acid (1) that: (i) encodes a polypeptide fragment (11) immunologically reactive with encodes a polypeptide fragment (11) immunologically reactive with crabbit polyclonal antibody raised against a 13 kba polypeptide of Borrella burgdorferi Bill, but not reactive with most proteins from other spirochaetes; and/or (ii) hybridizes under stringent conditions to specific nucleic acid sequences but not to genomic DNA from most other spirochaetes. (1), (II) and transformed cells are useful in vaccines to protect against infection by B. burgdorferi sensu lato. (I), (II) and antibodies raised against (II) are used to diagnose such infections, in standard immunoassays or amplification/hybridization tests. (1) are also used to produce recombinant (II). The 13 kD protein is involved in virulence and is highly conserved within B. burgdorferi sensu lato, but is absent from other Borrellas species (e.g. those responsible for relapsing fever or avain borrelosis). It should provide a more specific and sensitive antibody response, and diagnosis, 61 GSFAQGDILGGFLILGFDAVGIGLILTGAYLDIKALDKNAPKAAFKWTWGKGMMLAGAVT 120 1 MNKFLIVVLLAFCVFSSFAQADDSKSAFNLGAGEKLLAYETSKKDPIVPFLLNLFLGFGI Antigenic protein; vaccine; Lyme disease; infection; detection. Length 177; 16; Indels 87.0%; Score 786.5; DB 20; 86.5%; Pred. No. 2.6e-79; compared with use of whole bacteria as antiqen. Lathigra R; 7; Mismatches B. burgdorferi antigenic protein, f933.aa.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1;
                                                                                                                         This sequence represents a Borrelia burgdorferi (Bb) protein of the invention, which is suitable for use in a vaccine. The Bb polypeptides can be used in vaccines for eliciting protective antibodies to members of the Borrelia genus, particularly for the use against Lyme disease in mamans and animals. They can be used for preventing or attenuating an infection caused by a member of the Borrelia genus. The products can also be used for detection of members of the Borrelia genus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence represents a Borrella burgdorferi B313 protein. The present invention describes an isolated nucleic acid (1) that: (i) encodes a polypeptide fragment (II) immunologically reactive with rabbit polyclonal antibody raised against a 13 kDa polypeptide of Borrelia burgdorferi B313, but not reactive with most proteins from other spirochaetes; and/or (ii) hybridizes under stringent conditions to specific nucleic acid sequences but not to genomic DNA from most
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                60 IGSFAQGDILGGFLILGFDAVGIGLILTGAYLDIKALDKNAPKAAFKWTWGKGMMLAGAV 119

```

compared with use of whole bacteria as antigen. The present sequence represents a pl1 protein sequence from a best hit search.

3

```
The present invention describes an isolated nucleic acid (I) that: (i) encodes a polypeptide fragment (II) immunologically reactive with rabbit polychonal antibody raised against a 13 kba polypeptide of crabbit polychonal antibody raised against a 13 kba polypeptide of crabbit burgdorferi B313, but not reactive with most proteins from cother spirochaetes; and/or (ii) hybridizes under stringent conditions to specific nucleic acid sequences but not to genomic DNA from most cher spirochaetes. (I), (II) and transformed cells are useful in vaccines to protect against infection by B. burgdorferi sensu lato.

(I), (II) and antibodies raised against (II) are used to diagnose such infections, in standard immunoassays or amplification/hybridization tests. (I) are also used to produce recombinant (II). The 13 kD protein is involved in virulence and is highly conserved within B. burgdorferi sensu lato, but is absent from other Borrelia species (e.g. those responsible for relapsing fever or avain borrelosis). It should provide a more specific and sensitive antibody response, and diagnosis,
                                                                                                                                          ij
humans and animals. They can be used for preventing or attenuating an infection caused by a member of the Borrelia genus. The products can also be used for detection of members of the Borrelia genus.
                                                                                                                                                                                                                                                               GIGLILTGAYLDIKALDKNAPKAAFKWTWGKGMMLAGAVTMAVTRLTEIIIPFTFANSYN 140

The present sequence represents a Borrelia burgdorferi B313 N-terminal peptide. The present invention describes an isolated nucleic acid (I) that: (i) encodes a polypeptide fragment (II) immunologically reactive with rabbit polyclonal antibody raised against a 13 kDa polypeptide of Borrelia burgdorferi B313, but not reactive with most proteins from other spirochaetes; and/or (ii) hybridizes under stringent conditions to specific nucleic acid sequences but not to genomic DNA from most other spirochaetes (I), (II) and transformed cells are useful in vaccines to protect against infection by B. burgdorferi sensu lato. (I), (II) and antibodies raised against (II) are used to diagnose such infections, in standard immunoassays or amplification/hybridization tests. (I) are also used to produce recombinant (II): The I3 kD protein is involved in virulence and is highly conserved within B. burgdorferi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              sensu lato, but is absent from other Borrelia species (e.g. those responsible for relapsing fever or avain borrelosis). It should provide a more specific and sensitive antibody response, and diagnosis, compared with use of whole bacteria as antigen.

AAF67743 to AAF68080 encode the Corynebacterium glutamicum membrane construction and membrane transport (MCT) proteins given in AAB76510 to AAB76847. The MCT nucleic acids and proteins are useful in the identification of microorganisms which can be used to produce fine chemicals, for modulating fine chemical production in C. glutamicum or related bacteria (e.g. Brevibacterium lactofermentum), the typing or identification of C. glutamicum or related bacteria, as reference points for mapping C. glutamicum genome, and as markers for transformation.

AAF68082 and AAF68082 represent sequencing primers which are used in an example from the present invention.
                                    Corynebacterium glutamicum nucleic acids encoding membrane construction and membrane transport proteins or their portions, useful for typing or identifying C. glutamicum or related bacteria, and as markers for transformation -

NAME OF THE PROPERTY OF THE PR

```
This sequence represents a Borrelia burgdorferi (Bb) protein of the invention, which is suitable for use in a vaccine. The Bb polypeptides can be used in vaccines for eliciting protective antibodies to members of the Borrelia genus, particularly for the use against Lyme disease in humans and animals. They can be used for preventing or attenuating an infection caused by a member of the Borrelia genus. The products can also be used for detection of members of the Borrelia genus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ||::| ||||

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       6
                                                                                                                                                                            The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a protein described in the exemplification of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the European Patent Office.
                                                   Novel polynucleotides derived from Coryneform bacteria, for identifying mutation point of a gene, measuring expression of a gene, analysing expression profile or pattern of a gene and identifying homologous gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              VP-FLINLFLGFGIGSFAQGDIL-----GGFLILGFDAVGIGLILFGAYLDIKALDKNA 100

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ò
                                                                                                                                                                                                                                                                                    12;
                                                                                                                         This sequence represents a Borrelia burgdorferi (Bb) protein of the invention, which is suitable for use in a vaccine. The Bb polypeptides can be used in vaccines for eliciting protective antibodies to members of the Borrelia genus, particularly for the use against Lyme disease in humans and animals. They can be used for preventing or attenuating an infection caused by a member of the Borrelia genus. The products can also be used for detection of members of the Borrelia genus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Fsihi H, Dehoux P;

The present invention relates to the genome sequence of Listeria

monocytogenes BCD-e (see ABA03041). The genome sequence and fragments of
it are useful for selecting probes and primers for detecting genes in L.
monocytogenes and related organisms, and for studying genetic
monocytogenes and related organisms, and for studying genetic
monocytogenes and other genomes. The present invention proteins
concord by the genome sequence of the present invention. Proteins
expressed from the genome sequence of the present invention. Proteins
cartibodies, identification of L. monocytogenes and related organisms, and
for biosynthesis and biodegradation, especially biosynthesis of vitamin

B12. The genome sequence and proteins encoded by it are also useful for
selecting compounds that regulate gene expression and cell replication
and modulate L. monocytogenes-related diseases. In addition, the genome
sequence and proteins encoded by it are useful in pharmaceutical and
vaccines compositions for the treatment or prevention of infections by L.
cc monocytogenes and related organisms.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              δy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 7;
                                                                                                                                          AAY81501 to AAY81679 represent specifically claimed protein sequences isolated from Streptococcus pneumoniae. AAA05407 to AAA05590 represent specifically claimed nucleotide sequences isolated from S. pneumoniae. The sequences have antibacterial and antiinflammatory properties. The protein sequences, and fragments of them, are useful as immunogens and/or antigens. The nucleotide sequences can be useful as immunogens diagnostic assays. The proteins and nucleotides can be useful for the detection and diagnosis of S. pneumoniae. The protein sequences are also useful for screening an agent capable of antagonising, inhibiting or interfering with the function or expression of the proteins in which the agent is useful for treatment or prophylaxis of S. pneumoniae infection and meningitis. AAA05591 to AAA05614 represent primers used in the exemplification of the present invention.
                                                                     New Streptococcal protein, useful as a vaccine, for diagnosis of pneumococcal diseases and for screening agents capable of antagonizing or inhibiting expression of the protein
                                                                                                                                                                                                                                                                                                                                                                                                       341 AGALVLAIKKYVKVPRSLEGAKSILLPLLGTILTGFVMLAVNIPMAAINTAMNDFLGG- 399

prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes, their use in the discovery of novel antibiotics, the essential genes themselves and the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coll, Staphylococcus aureus, Salmonella typhi, Klabsiella pneumoniae, Pseudomonas aeruginosa and Enterococcus faccalis. The invention is also useful for the identification of potential new targets of or antibiotic development. The antisense nucleic acids can also be used to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein.

Control of the printed specification, but was obtained in electronic for the printed specification, but was obtained in electronic for the printed specification, but was obtained in electronic

This sequence represents a Helicobacter pylori GHPO protein of the invention. The polypeptides can be used for preventing or treating Helicobacter infections, and gastroducdenal diseases associated with these infections, including acute, chronic, and atrophic gastritis, and peptic ulcer diseases, e.g. gastric and duodenal ulcers. They can also be used for the production of antibodies. The products can also be used for detection and diagnosis.
New isolated Helicobacter polynucleotides - used to develop products for the diagnosis, prevention and treatment of Helicobacter infections and gastrointestinal diseases
                                                                                                                                                                                                Claim 8; Page 1770-1771; 2054pp; English.

A.Title: Genomic sequence of a Lyme disease spirochaete, Borrelia burgdorferi.
A.Rocession: G70239
A.Accession: G70239
A.Status: preliminary; nucleic acid sequence not shown; translation not shown A.Molecule type: DNA
A.Residues: 1-190
A.K.Ebs
A.Cross-references: GB.AE000784; NID:g2690041; PIDN:AAC65989.1; PID:g2690045; TIGR:BB.A.Experimental source: strain B31
A.Genetics: A.Genome: plasmid
C.; Guperfamily: Lyme disease spirochete plasmid hypothetical protein BBA01
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    PTS system, maltose and glucose-specific IIABC component (malx) homolog - Lyme diseas C; Species: Borrella burgdorferi (Lyme disease spirochete)
C; Species: Borrella burgdorferi (Lyme disease spirochete)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              8
hypothetical protein C27A7.3 - Caenorhabditis elegans
C; Species: Caenorhabditis elegans
C; Species: Caenorhabditis elegans
C; Date: 15-Oct-1999 #sequence_revision 15-Oct-1999 #text_change 15-Oct-1999
C; Accession: T19495
B; Harris, B.
Submitted to the EMBL Data Library, October 1996
A; Refearence number: 219132
A; Accession: T1945
A; Accession: T1945

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

SOFTWARE: PALENTIN Release #1.0, Version #1.25 (EPO)

CURRENT APPLICATION DATA:

APPLICATION NUMBER: US/08/617,860B

FILING DATE: 01-MAR-1996

PRIOR APPLICATION DATA:

APPLICATION NUMBER: PCT/EP94/02950

FILING DATE: 05-SEP-1994

APPLICATION NUMBER: D432951.2

FILING DATE: 04-SEP-1993

INFORMATION FOR SED ID NO: 32:

SEQUENCE CHARACTERISTICS:

LENGTH: 1850 Base pairs

TYPE: Nucleic acid

STRANDEDNESS: Double stranded
                                                                                                                                                                                                                                                                                                                                                                                                                                        CALF: 1.000
